

# PROJECT SYNOPSIS

## Pet Haven: Pet Adoption Center

---

**Project Title:** Pet Haven: Pet Adoption Center

**Category:** Web Application (Frontend Development)

**Domain:** Animal Welfare / Pet Adoption

**Technology used:** HTML5, CSS3 (current phase); JavaScript, React (planned future phases)

### 1. Project Overview

Pet Haven is a web-based pet adoption platform designed to connect potential adopters with pets available for adoption through an easy-to-use, responsive interface. The project is being developed incrementally. The current phase delivers a complete static user interface built with HTML5 and CSS3. JavaScript-based interactivity and a React implementation are planned for subsequent phases.

### 2. Problem Statement

Information about adoptable pets is often scattered across multiple sources or difficult to access. Potential adopters rarely have a simple, centralized way to view pet details before visiting in person. Adoption requirements and procedures are frequently unclear or presented inconsistently. Manually collecting adopter information through phone calls or in-person forms is inconvenient for both staff and applicants. There is a clear need for a centralized, easy-to-navigate platform that brings pet and adoption information together in one place.

### 3. Objectives

The project aims to develop a user-friendly pet adoption platform that displays available pets along with relevant information and photographs. It aims to present adoption requirements and procedures clearly, and to provide an online adoption application interface so applicants no longer need to rely on manual, in-person processes. The interface is designed to be responsive across desktop and mobile devices, and the overall architecture is intended to support dynamic, database-driven functionality in future phases.

### 4. Scope of the Project

#### 4.1 Current Scope

The current implementation focuses on the static user interface, built using HTML5 and CSS3. It includes a home page with a call-to-action, an About section describing the adoption center, an Available Pets section with photos and details, individual pet detail presentation, an explanation of adoption requirements and process, an adoption application form, an FAQ section, contact information, and a fully responsive design across screen sizes.

## 4.2 Future Scope

The system is designed to be extended in later phases with dynamic functionality, database integration, authentication, administrative features, and API connectivity, without requiring a redesign of the current structure.

## 5. Proposed Modules

### User Module

Allows visitors to browse available pets, view pet information, review adoption requirements, and submit an adoption application.

### Pet Module

Covers each pet's name, breed, age, gender, personality, vaccination status, availability, and image.

### Adoption Module

Handles the adoption application form, preferred pet selection, applicant details, and the stated reason for adoption.

### Information Module

Presents the adoption process walkthrough, pet-care tips, FAQs, and contact details.

### Admin Module — Future Scope

Future versions may include an admin module for adding, updating, deleting, and managing pet records and adoption applications.

## 6. Technology Stack

| Phase                         | Technology     |
|-------------------------------|----------------|
| Static UI                     | HTML5 + CSS3   |
| Dynamic functionality         | JavaScript     |
| Final frontend implementation | React          |
| Version control               | Git / GitHub   |
| Future data layer             | Database / API |

## 7. Functional Requirements

Users can navigate through the different sections of the website, view available pets and their details, and access adoption requirements and the adoption process. They can fill out and submit an adoption application, select a preferred pet on the form, and view FAQs and contact information. Future versions may allow administrators to manage pet information and adoption applications through a dedicated admin interface.

## **8. Non-Functional Requirements**

The system should be easy to understand and navigate for a general, non-technical audience, and should remain responsive across desktop, tablet, and mobile screen sizes. Pages should load efficiently through optimized images and lightweight frontend code. HTML, CSS, and later JavaScript should be maintained as separate, well-organized components, and the website should function correctly on commonly used modern browsers. The system should also be structured so that additional functionality, such as dynamic behavior, backend integration, and new modules, can be added in later phases without reworking the existing design.

## **9. Future Enhancements**

Planned enhancements include JavaScript-based form validation and interactive feedback, dynamic pet filtering and search, and interactive adoption status tracking. Later phases may add an admin dashboard for managing listings and applications, user authentication, database integration, API integration for live pet data, an email or notification system, and a full React-based frontend.

## **10. Development Methodology**

The project will be developed incrementally, beginning with the static user interface, followed by dynamic client-side functionality, and finally a React-based implementation. Backend, database, and API integration may be incorporated in subsequent phases depending on project requirements and available time.

## **11. Conclusion**

Pet Haven is a responsive, web-based pet adoption platform that provides centralized pet information and an adoption application interface. It is being developed incrementally using HTML, CSS, JavaScript, and React, with database and API integration positioned as a future extension. This scope keeps the current deliverable realistic and fully achievable for a student team, while leaving clear, intentional room for growth in later phases.
